SUMMARY

Software engineer shipping production systems since 2023, currently building the Go API gateway layer carrying SCB Easy's 10M+ user banking platform off its legacy on-premise gateway. Strongest in backend architecture — hexagonal design, REST APIs, incremental microservice migration — and used to owning delivery end to end, from requirements to containerized deployment.

SKILLS

Languages: Go, TypeScript, JavaScript, Ruby, Python, SQL, HTML/CSS | *Familiar:* Java, Haskell
Backend: Fiber, Gin, Ruby on Rails, Node.js, REST APIs, Microservices, Hexagonal Architecture, System Design
Frontend: React, Next.js, Vite, Tailwind CSS, MUI, TanStack Query, PWA
Infrastructure: PostgreSQL, Redis, Docker, Kubernetes, AWS, Kong API Gateway, CA Layer 7, Nginx, Supabase, Vercel, Linux
Observability & CI/CD: Prometheus, Grafana, ELK Stack, GitHub Actions, Jenkins, HashiCorp Vault, Git
Practices: Data Structures & Algorithms, TDD, SOLID, OOP, Agile/Scrum, AI-Assisted Development | *Spoken:* Thai (Native), English (Intermediate)

EXPERIENCE

Associate Software Engineer *May 2025 – Present*
SCB TechX, Bangkok, Thailand (Hybrid) Go, Fiber, Kong, Ruby on Rails, React, TypeScript, PostgreSQL, Redis, Kubernetes

- Building the Go token-validation and routing service that sits behind Kong to replace a legacy on-premise gateway, letting SCB Easy's 10M+ user platform move service by service instead of through one high-risk cutover.
- Designed the gateway's plugin system, routing engine, and observability stack (Prometheus, structured logging), giving the migration team per-route visibility before rollout.
- Structured the service in hexagonal architecture with dependency injection and interface-driven design, keeping business logic fully unit-testable and decoupled from Kong, Redis, and every infrastructure dependency.
- Prototyped declarative config sync (Kong decK pattern: YAML route definitions with diff and rollback) and per-service circuit breaking, targeting GitOps-style config management and safe phased rollout across the migration's 30+ services.
- Delivered an enterprise asset management platform end to end: a database-driven workflow engine covering four parallel lifecycles (request, spare, repair, return), enforcing approval chains per role and step for six user roles under Azure AD SSO.
- Built its reporting dashboards (utilization, financial summaries, processing efficiency, Excel/CSV export) and an installable PWA with push notifications, so asset managers self-serve reports.
- Applied AI-assisted development across code generation, testing, refactoring, and architecture review to speed delivery.

Full Stack Developer (Work-Study Scholarship) *2023 – 2025*
Chiang Mai University, Faculty of Engineering, Chiang Mai, Thailand Go, React, TypeScript, PostgreSQL, Docker

- Shipped two production web applications adopted across the faculty, owning each from requirements through containerized deployment.
- Built SD-Booking, a real-time room reservation system with booking-conflict detection, role-based access, an admin dashboard, and mobile push notifications — adopted for daily faculty scheduling and still in active use today.
- Digitized a paper-based certificate process into a multi-stage approval workflow, removing manual routing between offices and cutting turnaround on every request.
- Applied hexagonal architecture across both systems, building RESTful Go APIs against React/TypeScript frontends on PostgreSQL.

PROJECTS

FitJourney — Fitness Tracking Platform — Side Project *2026*
Next.js, Supabase, Tailwind CSS, OpenAI API, Vercel

- Shipped a full-stack fitness PWA consolidating workout logging, nutrition, body metrics, and AI meal scanning into one self-hosted tool — a monorepo on Supabase (auth, DB, storage) with Vercel edge deployment and analytics dashboards.

Twitch Chat TTS Bot — Side Project *2026*
Bun, Microsoft Edge TTS, tmi.js, FFplay

- Engineered a real-time Twitch TTS bot piping synthesized audio straight from memory to playback, eliminating disk I/O, with a priority queue, anti-spam filtering, and automated OAuth refresh to survive high-volume chat unattended.

EDUCATION

Bachelor of Engineering in Computer Engineering *Graduated 2025*
Chiang Mai University Second-Class Honours GPA: 3.32/4.00
Thesis: *LongPlan* — study plan validator enforcing curriculum rules via graph algorithms (topological sort, cycle detection); Go and React.
